Innovative projects and teamwork: Students are encouraged to take up innovative projects in different fields of their interest and teachers play a very important role in accomplishing these. Under the supervision of faculty members students voluntarily work for various interdisciplinary projects and actively participate in design contests conducted by industry leaders. Patent details of the faculties and students during the assessment years are shown below.

(54) Title of the invention: A NOVEL DESIGN OF UV DISINFECTON ROBOT

(55) International classification: A61L60002100000, C07K0016100000, A61N0053700000, B29Y0000000000, A61L0002180000

(56) International Application
No: PCT/ \nFiling Date: 01/08/1999

(57) Abstract:
The UV 222nm robot is the most effective in terms of killing germs and viruses. Contact, droplet, aerosol, fomite, faecal-oral blood borne, and animal to human transmission are all ways of virus and bacteria transmission. UV222nm light is utilised to cleanse the virus, and it is used to disinfect this form of transmission. In the past, we used procedures such as cleaning with water and soap or a detergent, sanitizing, and other similar ways to disinfect the virus. It is costly to employ all of these methods, and they will need to be replaced after they are exhausted. However, the UV 222nm is a one-time purchase with a lengthy lifespan. As a result of employing UV222nm, fewer herbicides and pesticides are used. It will destroy viruses and bacteria, require less time to eliminate pathogens such as viruses and bacteria, and be used in agriculture, medicine, food processing, and industrial processes. The virus will be propagated in public places by coughing, sneezing, speaking, and breathing; the infection will be spread through all of these methods. Because no one can wash their hands all the time in a public location, the virus can be transmitted using UV 222nm in all public spaces such as hospitols, bus stops, shopping malls, and other places where we may install UV 222nm to disinfect the virus. UV radiation with a wavelength of 222nm will eliminate all viruses and bacteria without affecting humans or the environment. The current work of the UV Robot is aimed at finding answers to problems that arise in a range of disciplines, including medicine, agriculture, food processing, commercial and industrial waste, and so on. Sanitizing public areas is necessary in order to prevent the spread of illnesses. Bacterial and fungal infections cause the majority of all diseases. Solid edges and manufacturing processes are used in the construction of disinfection robots. The coronavirus is sanitised and the germs are eradicated using UV light at a wavelength of 222 nm. One of the current research aims is to eradicate pathogens such as viruses and bacteria. Different viruses, bacteria, and fungi may be eradicated with UV technology. Viruses, fungi, and bacteria are all examples of pathogens.

- **Smart Board:** The institution provides the smart Board for teaching. It makes learning better by interactive lessons, web access and allows students to collaborate with each other.

- **YouTube Channel:** The department has its own youtube channel (EEE PESCE), where the faculties will upload the videos related to the curriculum courses and thereby the students will make use of these videos for their academics.

Thank you for the video, how do you determine the value of the inductor that is in series with the rheostat?

Project Title:
Clean and Healthy India through Low Cost Light
Pedagogical Initiatives :

1. The EEE department has realized importance of Pedagogy Training for their faculty members and thus encourages them to undergo training organized by various colleges and institutes either by online or offline mode.

2. Generally faculties are encouraged to attend training which provides an insight into the modern teaching processes and thereby the teacher can be more effective in terms of teaching learning process.

3. The faculty members attend pedagogy training organized both by our institution and other institutions as well (Example: GTDC).

4. The faculties are advised to enroll for NPTEL courses on recent & emerging trends. Fig shows faculty certification in ICT/NPTEL Training

Faculty members use various pedagogical methods for the effective teaching-learning process. The Department has taken the following pedagogical initiatives:

i) **Chalk & Board:** The conventional and most effective instructional method is the chalk & board and the faculty commonly use this traditional method.

ii) **Project-based learning (PBL):** Project-based learning is an innovative practice used to implement outcome-based education at our institute. Students are encouraged to carry out multidisciplinary projects to gain engineering knowledge through mini projects.

iii) **Industrial visits:** Field visits are organized regularly to support curriculum delivery.

iv) **Case studies:** Case study approaches are used which provide students an application of engineering knowledge.
